Fairtrade Carbon Credits price methodology

The following summary table and graph describe how Fairtrade International established the Fairtrade Minimum Prices for carbon credits projects and provides an explanation of the cost items taken into account to calculate the average cost of sustainable production. Fairtrade Minimum Prices and Premiums are set for three types of carbon projects: energy efficiency, renewable energy, and afforestation / reforestation projects. The Fairtrade Minimum Price was established through the evaluation of the main implementation costs of carbon projects (investment costs, project costs, carbon costs, revenues and business margin).

<table>
<thead>
<tr>
<th>Main cost items included</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Investment Costs</td>
<td>Investment costs include infrastructure, machinery, light investment, vehicles, investments in land, loan payments (i.e. used for buying equipment), etc. These are, broadly speaking, all the investments done to physically implement the project.</td>
</tr>
<tr>
<td>b. Project Costs</td>
<td>Costs for carbon activities such as management, operation, production, transportation, distribution, maintenance, training, monitoring, etc. These are broadly speaking all services required for maintaining and operationally running the project. Also included in the project costs is an additional percentage for activities ensuring the transfer of knowledge and management responsibilities from project facilitators to producer organizations (e.g. production, distribution, maintenance).</td>
</tr>
<tr>
<td>c. Carbon costs</td>
<td>Costs for activities such as opening carbon account, field tests, drafting documents, local stakeholder consultation, validation, verification, registration, monitoring, issuance, etc. Also included in the carbon costs is an additional percentage for activities ensuring the transfer of knowledge and management responsibilities from project facilitators to producer organizations (e.g. carbon monitoring, managing carbon account). Fairtrade certification fees are also included in the Fairtrade Minimum Price.</td>
</tr>
<tr>
<td>1. Total costs</td>
<td><strong>Sum of all the main costs</strong> ((a + b + c)). Based on average values or estimates for all cost items included in a to c, the total average costs for a typical project of each project type (energy efficiency, renewable energy, afforestation / reforestation) were calculated.</td>
</tr>
<tr>
<td>2. Business margin</td>
<td>On top of the costs (a to c), a business margin of 10% for energy projects and 5% for afforestation / reforestation projects has been added to guarantee additional financial benefits.</td>
</tr>
<tr>
<td>3. Estimated revenues of the project</td>
<td>Potential revenues produced by the project (sale of cooking devices or forest products, energy production, etc.)</td>
</tr>
<tr>
<td>4. FCC Minimum Price</td>
<td>For the calculation of the Fairtrade Minimum Price, the estimated revenues from a project were subtracted from the average costs and the business margin of a project. The Fairtrade Minimum Price for one Fairtrade carbon credit ((\pm 1 \text{tCO}_2\text{e})) is calculated by dividing the average price per project by the average quantity of credits expected to be generated by a project of each project type. (4 = (1 + 2 - 3) / \text{number of credits})</td>
</tr>

Fairtrade Carbon Credits price methodology

FAIRTRADE CARBON CREDITS

Energy efficiency

Renewable energy

Afforestation / Reforestation

Investment cost

Project cost

Carbon cost

Business margin

Revenues

- Infrastructure
- Light investment (Computers, tables, etc.)
- Machines
- Land
- Etc.

- Management
- Installations
- Operation
- Transports
- Maintenance
- Training
- Monitoring
- Transferring knowledge and management responsibilities

- Fairtrade certification
- PDD fees
- Registration fees
- Validation
- Verification
- Etc.
- Transferring knowledge and management responsibilities

- Energy Efficiency and Renewable Energy: 10%
- Afforestation/Reforestation: 5%

- Improved device (cook stove, water filter, etc.)
- Electricity produced
- Expected volume of wood
- Etc.

= Fairtrade Minimum Price
